Notes

The primary focus of the attached tables is the comparison of work travel between 1991 and 2001 using data from the national census. Areas have been defined to divide the county into 15 parts. These notes explain the more important differences in the methods and definitions of the two census surveys and the steps that have been taken to produce true comparisons of travel between the two.

Source of data

2001 data - The Census office released a dataset in June 2004 containing nearly 6 million records, each record describing the number of people moving by each means of travel between an output area (OA) of residence and OA of the workplace. Each local authority district is divided into census wards and these are divided into OAs. The size of the OA is quite small, containing in the region of about 120 households. In order to prevent the disclosure of personal information a system of randomisation of the counts of people reported on each record has been introduced, so that counts of 1 and 2 never occur (they are replaced by either 0 or 3). Overall, about 85% of the records show a total count of 3. Consequently, the totals for wards and districts obtained from this dataset do not exactly match the totals published by the Census office in tables based on larger areas.

1991 data - The County Council obtained a dataset from the Census office some years ago comprising the journeys to work of people living or working in Oxfordshire. The dataset is a 10% sample of the census, known as the Special Workplace Statistics. Each record describes the number of people moving by each means of travel, also the number of people in each distance band, between the census ward of residence and the census ward of workplace. For areas outside Oxfordshire the district of residence or workplace is given. Since the sample is a 10% sample of households, there is no guarantee that the sample is exactly representative either of work journeys or of the means of travel. Consequently the totals for these counts do not quite match the totals published by the Census office in other tables.

Area definitions

The 2001 census wards differ markedly from the 1991 census wards, nevertheless the areas used in the analysis of the 2001 data closely match the areas defined from the 1991 census wards through the selection of 2001 census wards and, where appropriate, 2001 OAs. Where there is a deviation between the boundaries of 2001 OAs and the 1991 wards no attempt has been made to apportion 2001 OAs in fractions. In the case of the major towns the 2001 boundaries describe an area slightly larger than that described by the 1991 boundaries, which is consistent with the growth of the town. Thus the extent of these towns is satisfactorily represented in both 1991 and 2001. The one exception to this is in the case of Witney where the 1991 boundary does not include the Deer Park development that had occurred at the time of the 1991 Census. Therefore the extent of Witney in 1991 is underrepresented in 1991 and the growth from 1991 to 2001 is exaggerated.

The 1991 census ward boundaries have been used to define the areas as there is no data available for 1991 other than for these boundaries.

Data analysis

2001 – In this dataset people with ‘no fixed workplace’ are included with their workplace set to the same OA as the residence, but these people are not otherwise separately identified. This analysis places all people whose workplace OA is the same as the residence OA in the category ‘no fixed workplace’. It is an inescapable fact that some questions in the census are not fully answered. Whilst in the previous census the count of non-answers was reported, it is the policy of the Census office for the 2001 census in the case of nearly all questions (the question on religion is the famous exception) to substitute estimates for non-answers based on the other known facts. This is known as the ‘one-number’ process: missing values are estimated just once. There is therefore no report of the count of unknown workplaces. The substitute estimates are simply aggregated within the published tables.

1991 - The numbers from the 10% sample dataset have been first simply multiplied by 10. For each ward in Oxfordshire the number of people whose workplace is not known has been used to derive an expansion factor. This has been applied to all the records with a known workplace, thus substituting the unusable part of the sample. The process does not affect the count of people who work 'at home' or with 'no fixed workplace'. The expansion of known workplaces increases the estimate of the number of people travelling from Oxfordshire to outside Oxfordshire. The records representing people travelling into Oxfordshire have therefore been expanded at the same rate to allow for similar under-reporting of this movement.

2001 and 1991 - The workplaces given as 'outside Great Britain', also 'offshore' and Scotland/N. Ireland in the 2001 dataset, are relatively very few and are simply ignored in this analysis, as are people who live 'outside Great Britain'.

Means of travel

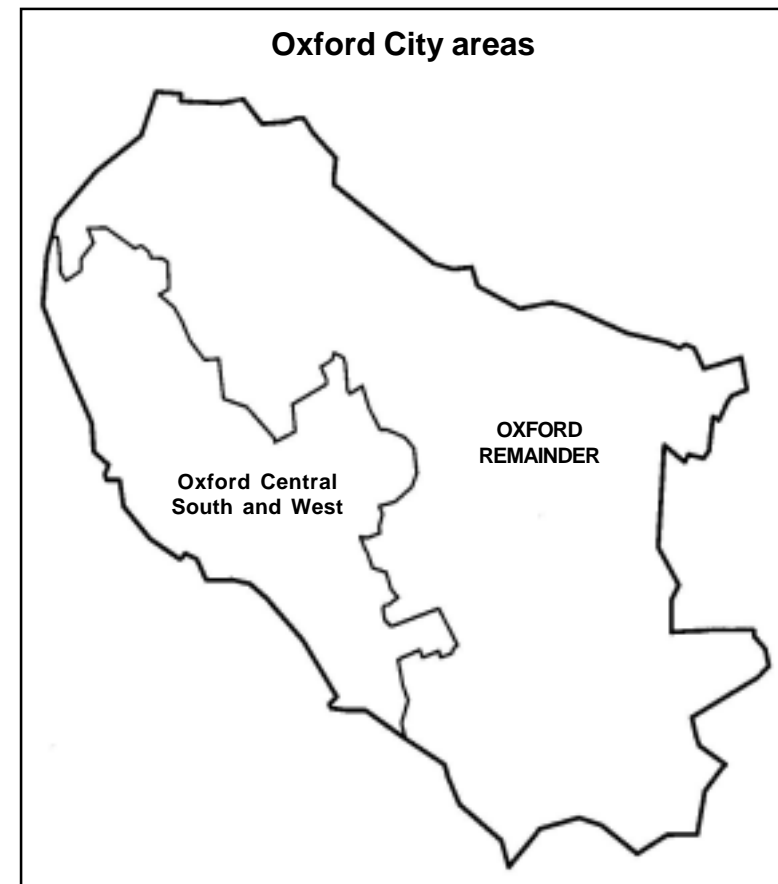

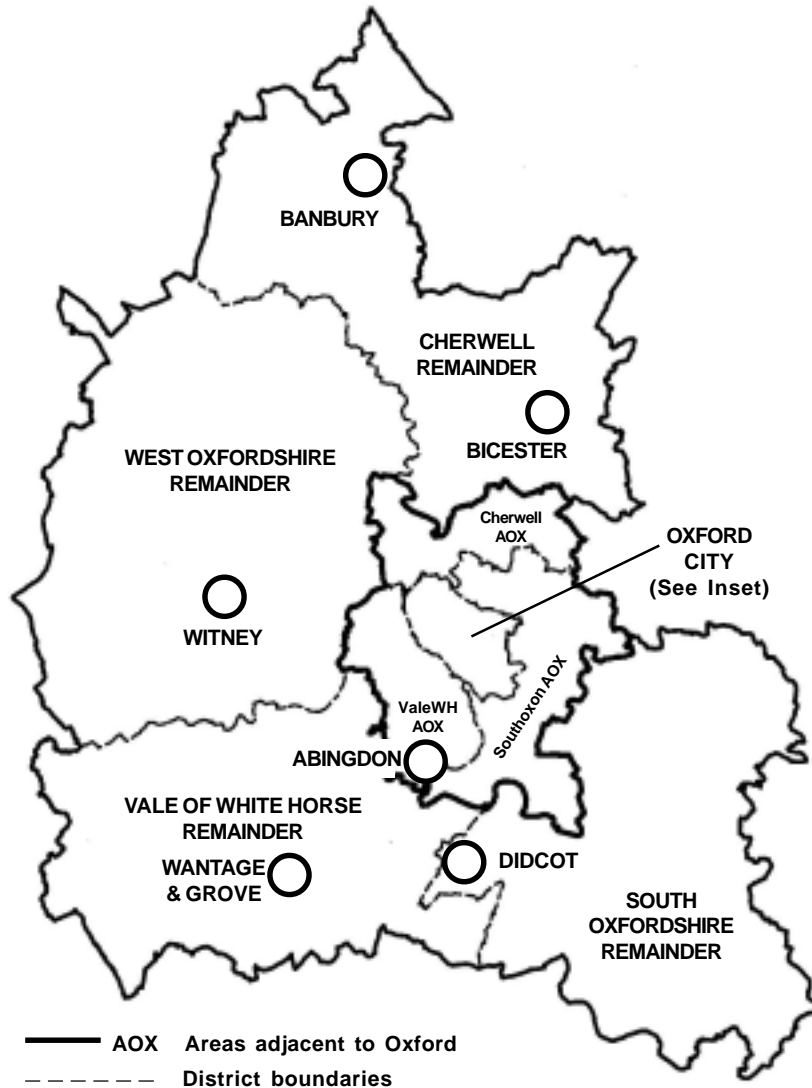

2001 - There are some changes in the census question on means of travel. The most significant change concerns people who work at home (these people, who actually don't travel to reach their workplace, are included by ONS in the means of travel tables so that all people in work are accounted for). The census question has been changed to 'at or from home' instead of the previous question, simply 'at home'. The new question widens its scope and admits some people who might in 1991 have chosen the answer 'no fixed workplace', so the apparent increase in 'home' workers probably exaggerates the change. The results do show that, taking 'home' and 'no fixed workplace' together, these have increased very considerably. The introduction of two new means of travel, 'taxi' and 'other', slightly confuses comparisons with 1991 as one can not know what answer these users would have chosen in 1991. However, the frequency of these choices is quite low.

1991 - No attempt has been made to estimate a redistribution of the fairly infrequent 'not stated' means of travel. This is simply aggregated within 'all other'.

Travel distance

2001 - The dataset is supplied without distance bands although ONS does publish other tables that do include categories for journey length between residence and workplace. Travel distances have therefore been calculated and appended to each record. The travel distance is based on the crow-fly distance between the residence OA and the workplace OA.
