2026 Air Quality Annual Status Report (ASR)

**In fulfilment of Part IV of the Environment Act 1995
Local Air Quality Management, as amended by the
Environment Act 2021**

Date: June 2026

Information	Oxford City Council Details
Local Authority Officer	Charles McQuarrie
Department	Environmental Sustainability
Address	Town Hall, St Aldates Oxford (OX1 1BX)
Telephone	01865 249811
E-mail	airquality@oxford.gov.uk
Report Reference Number	ASR2026
Date	June 2026

Local Responsibilities and Commitment

This ASR was prepared by the Environmental Sustainability Team of Oxford City Council with the support and agreement of Oxfordshire County Council colleagues.

This ASR has been approved by:

Cllr Anna Railton

(Oxford City Council's Cabinet Member for Planning and Zero Carbon Oxford)

Kate Holburn

(Deputy Director of Public Health & Communities, Oxfordshire County Council)

If you have any comments on this Annual Status Report please send them to the Environmental Sustainability Team at:

Town Hall, St Aldates – OX1 1BX (Oxford)
01865 249811 or email us at: airquality@oxford.gov.uk

Executive Summary: Air Quality in Our Area

Breathing in polluted air affects our health and costs the NHS and our society billions of pounds each year. Air pollution is recognised as a contributing factor in the onset of heart disease and cancer and can cause a range of health impacts, including effects on lung function, exacerbation of asthma, increases in hospital admissions and mortality.

Air pollution particularly affects the most vulnerable in society, children, the elderly, and those with existing heart and lung conditions. Low-income communities are also disproportionately impacted by poor air quality, exacerbating health and social inequalities.

Pollutants of Greatest Concern

The city of Oxford, as with many urban areas throughout the United Kingdom, is subject to poor air quality, particularly in areas with high levels of road traffic. In Oxford, Nitrogen dioxide (NO₂) is the pollutant of greatest concern. The entire city has been a designated an Air Quality Management Area (AQMA) for NO₂ since 2010.

Citywide, NO₂ concentrations fell by an average of 5.6% in 2025, decreasing from 18 µg/m³ in 2024 to 17 µg/m³. In places of high bus traffic, such as High Street, we have seen reductions of up to 19%, again largely due to the Zero Emission Bus Regional Areas (ZEBRA) scheme, through which 159 electric buses have been introduced into Oxford's bus fleet. The rapid transition away from diesel buses on core routes has delivered substantial reductions in tailpipe emissions, particularly in the city centre and along key radial corridors where bus movements are frequent and exposure is high such as High Street and St. Aldates. Despite the ZEBRA scheme being fully implemented by December of 2024, 2025 was the first year to see the full results of this intervention. An evaluation report of the ZEBRA scheme can be found [here](#).

St. Clements, historically one of Oxford's highest NO₂ locations, and the last remaining site above our local annual mean target, has seen a marked improvement, with annual mean concentrations falling from 34 µg/m³ in 2024 to 28 µg/m³, a reduction of about 18%.

PM_{2.5} concentrations increased slightly at both monitoring locations. At St. Ebbes, annual mean concentrations rose from 6 µg/m³ to 7 µg/m³, while Oxford High Street increased from 7 µg/m³ to 9 µg/m³. Although there was a slight increase, it is important to note that

PM_{2.5} can be affected by long-range transport sources as well as local sources. Despite these increases, Oxford has consistently met all UK legal limits in recent years and in 2025 both sites remain well below the annual mean PM_{2.5} concentration target of 10 µg/m³ for England by 2040.

Meeting Oxford's Local NO₂ Target

Oxford's Air Quality Action Plan (AQAP) 2021–2025 set an ambitious local objective to reduce annual mean nitrogen dioxide (NO₂) concentrations to 30 µg/m³ across the city by the end of 2025. Based on robust analysis of data from our monitoring sites citywide, the Council can now confirm that this target has been achieved. This represents a major milestone in Oxford's long-standing efforts to improve air quality and protect public health, particularly given the complexity of Oxford's transport system and the historically high levels of roadside NO₂ associated with traffic emissions.

Achieving this target is significant not only because it exceeds the national annual mean objective of 40 µg/m³, but because it demonstrates that sustained local action can deliver measurable improvements in air quality within an urban environment. Lower NO₂ concentrations are associated with reduced risks of respiratory and cardiovascular disease, improved quality of life for residents, and health benefits for vulnerable groups including children, older people, and those with existing health conditions. The achievement therefore marks an important contribution to tackling health inequalities and creating a healthier city.

This success reflects the cumulative impact of a coordinated package of interventions delivered in partnerships over several years. A central contribution has been made by the electrification of Oxford's bus fleet under the ZEBRA programme, which means electric buses account for 69% of the total bus mileage for the city.

The introduction of the Zero Emission Zone (ZEZ) in Oxford city centre in February of 2022 has also played a role. By incentivising the use of zero-emission vehicles and discouraging the most polluting traffic from entering the central area, the ZEZ has helped to reduce NO₂ concentrations in locations that have historically experienced exceedances in the city centre. The ZEZ has further helped to accelerate behaviour change, encouraging residents, businesses, and visitors to consider cleaner modes of travel and vehicle choices.

Oxfordshire County Council also introduced a congestion charge in October 2025 at four locations across the city. The impact of this scheme has not yet been analysed as there has not been enough time to gather air quality data. More analysis on the impact of the congestion charge should be made available in future ASRs.

Alongside regulatory and infrastructure-led measures, public awareness and engagement campaigns have supported progress by increasing understanding of air quality issues and promoting cleaner travel choices. Campaigns encouraging walking, cycling, public transport use, and reduced engine idling have helped build public support for air quality interventions and reinforce individual actions that collectively contribute to lower emissions. The OXONAIR website also allowed residents and visitors engage with air quality issues by providing accessible information from Oxford's monitoring network. By improving transparency and understanding of air pollution levels and trends, OXONAIR has supported informed decision-making, increased awareness of the health impacts of air pollution, and strengthened public support for air quality measures.

Despite reaching the local target set out in the AQAP (2021 – 2025), Oxford City Council recognises that more must be done, and the new AQAP (2026 – 2030) sets an even more ambitious local NO₂ target of 20 µg/m³ to achieve across the city by 2030, going beyond the UK's legal limit of 40 µg/m³. This reflects the understanding that no level of air pollution is truly safe and underscores the city's commitment to achieving the lowest and safest possible levels.

Oxford City Council is well on track to meet the new "20 by 30" local annual mean NO₂ target. Figure 14 in Appendix D shows that 73% of all sites are already at or below 20 µg/m³.

provides a brief explanation of the key pollutants relevant to Local Air Quality Management and the kind of activities they might arise from.

Table ES 1 - Description of Key Pollutants

Pollutant	Description
Nitrogen Dioxide (NO ₂)	Nitrogen dioxide is a gas which is generally emitted from high-temperature combustion processes such as road transport or energy generation. NO ₂ has a clear local pattern and is mostly concentrated where it is emitted: in urban areas and by busy roads, due to its relatively short lifetime (a few hours).
Particulate Matter (PM ₁₀ and PM _{2.5})	Particulate matter is everything in the air that is not a gas. Particles can come from natural sources such as pollen, sea spray, and dust from soil or volcanic activity, as well as human made sources such as smoke from fires, emissions from industry and vehicles, and wear from tyres and brakes. When emitted, these particles can stay in the air for days or weeks, and travel distances of hundreds of miles. As a result, PM concentrations measured locally are often influenced by distant activities, many of which fall outside the jurisdiction or control of local authorities. PM₁₀ refers to particles under 10 micrometres. Fine particulate matter or PM_{2.5} are particles under 2.5 micrometres.
Ozone (O ₃)	Ozone (O ₃) is not emitted directly into the atmosphere in significant quantities, but is a secondary pollutant produced by reaction between nitrogen dioxide (NO ₂) and hydrocarbons, in the presence of sunlight. Peak O ₃ episodes are therefore strongly linked to typical summer weather conditions (high temperatures, sunny weather), giving rise to the so called "summer smog".

Air Quality in Oxford: Trends in 2025

Oxford's most recent source apportionment [study](#) (February 2025) showed that the largest contributor to nitrogen oxides (NO + NO₂) emissions was the transport sector, accounting for 44% of total emissions of these pollutants. This is followed by industry and services (30%), domestic heating (26%), and other sources – including waste, agriculture, solvents and natural sources – contributing less than 1%.

For PM_{2.5} emissions, the leading source is domestic heating (35%), followed by transport (24%), industry and services (24%), waste (8%), solvents (5%) and nature and agriculture (4%).

Between 2015 and 2025, average NO₂ levels in Oxford fell by 53%. Since 2021, the year the city launched the Air Quality Action Plan (2021 – 2025), average NO₂ levels have decreased by 26%. In 2025, for the third consecutive year, Oxford met all UK legal limits for NO₂ in places of relevant exposure.

Citywide, NO₂ concentrations fell by an average of 5.6% in 2025, decreasing from 18 µg/m³ in 2024 to 17 µg/m³. In places of high bus traffic, such as High Street, we have seen reductions of up to 19%, again largely due to the Zero Emission Bus Regional Areas (ZEBRA) scheme, through which 159 electric buses have been introduced into Oxford's bus fleet. The rapid transition away from diesel buses on core routes has delivered

substantial reductions in tailpipe emissions, particularly in the city centre and along key radial corridors where bus movements are frequent and exposure is high such as High Street and St. Aldates. Despite the ZEBRA scheme being fully implemented by December of 2024, 2025 was the first year to see the full results of this intervention. An evaluation report of the ZEBRA scheme can be found [here](#).

St. Clements, historically one of Oxford's highest NO₂ locations, and the last remaining site above our local annual mean target, has seen a marked improvement, with annual mean concentrations falling from 34 µg/m³ in 2024 to 28 µg/m³, a reduction of about 18%.

PM_{2.5} concentrations increased slightly at both monitoring locations. At St. Ebbes, annual mean concentrations rose from 6 µg/m³ to 7 µg/m³, while Oxford High Street increased from 7 µg/m³ to 9 µg/m³. Although there was a slight increase, it is important to note that PM_{2.5} can be affected by long-range transport sources as well as local sources. Despite these increases, Oxford has consistently met all UK legal limits in recent years and in 2025 both sites remain well below the annual mean PM_{2.5} concentration target of 10 µg/m³ for England by 2040¹.

Meeting Oxford's Local NO₂ Target

Oxford's Air Quality Action Plan (AQAP) 2021–2025 set an ambitious local objective to reduce annual mean nitrogen dioxide (NO₂) concentrations to 30 µg/m³ across the city by the end of 2025. Based on robust analysis of data from our monitoring sites citywide, the Council can now confirm that this target has been achieved. This represents a major milestone in Oxford's long-standing efforts to improve air quality and protect public health, particularly given the complexity of Oxford's transport system and the historically high levels of roadside NO₂ associated with traffic emissions.

Achieving this target is significant not only because it exceeds the national annual mean objective of 40 µg/m³, but because it demonstrates that sustained local action can deliver measurable improvements in air quality within an urban environment. Lower NO₂ concentrations are associated with reduced risks of respiratory and cardiovascular disease, improved quality of life for residents, and health benefits for vulnerable groups including children, older people, and those with existing health conditions. The

¹ For a more detailed breakdown of PM_{2.5} and PM₁₀, go to section 3.2.2

achievement therefore marks an important contribution to tackling health inequalities and creating a healthier city.

This success reflects the cumulative impact of a coordinated package of interventions delivered in partnerships over several years. A central contribution has been made by the electrification of Oxford's bus fleet under the ZEBRA programme, which means electric buses account for 69% of the total bus mileage for the city.

The introduction of the Zero Emission Zone (ZEZ) in Oxford city centre in February of 2022 has also played a role. By incentivising the use of zero-emission vehicles and discouraging the most polluting traffic from entering the central area, the ZEZ has helped to reduce NO₂ concentrations in locations that have historically experienced exceedances in the city centre. The ZEZ has further helped to accelerate behaviour change, encouraging residents, businesses, and visitors to consider cleaner modes of travel and vehicle choices.

Oxfordshire County Council also introduced a congestion charge in October 2025 at four locations across the city. The impact of this scheme has not yet been analysed as there has not been enough time to gather air quality data. More analysis on the impact of the congestion charge should be made available in future ASRs.

Alongside regulatory and infrastructure-led measures, public awareness and engagement campaigns have supported progress by increasing understanding of air quality issues and promoting cleaner travel choices. Campaigns encouraging walking, cycling, public transport use, and reduced engine idling have helped build public support for air quality interventions and reinforce individual actions that collectively contribute to lower emissions. The [OXONAIR](#) website also allowed residents and visitors engage with air quality issues by providing accessible information from Oxford's monitoring network. By improving transparency and understanding of air pollution levels and trends, OXONAIR has supported informed decision-making, increased awareness of the health impacts of air pollution, and strengthened public support for air quality measures.

Despite reaching the local target set out in the AQAP (2021 – 2025), Oxford City Council recognises that more must be done, and the new AQAP (2026 – 2030) sets an even more ambitious local NO₂ target of 20 µg/m³ to achieve across the city by 2030, going beyond the UK's legal limit of 40 µg/m³. This reflects the understanding that no level of air pollution

is truly safe² and underscores the city's commitment to achieving the lowest and safest possible levels.

Oxford City Council is well on track to meet the new "20 by 30" local annual mean NO₂ target. Figure 14 in Appendix D shows that 73% of all sites are already at or below 20 µg/m³.

Actions to Improve Air Quality

The following lists all the air quality measures that the City Council and its partners have delivered over the last LAQM reporting year (June 2025 to June 2026) to improve air quality in the city. The list is presented in chronological order:

June 2025: Oxford City Council was awarded £21m from Green Heat Network Fund to enable the council to explore the potential for Oxford's first District Heat Network (DNC) ([link to press release](#)). The project is expected to significantly reduce city-wide emissions coming from buildings.

² In recent years, several studies seemed to indicate the existence of harmful effects of air pollution at levels below air quality standards previously considered to be safe. However, it was only on the 22nd September 2021, when the World Health Organization (WHO) updated its global air quality [guidelines](#) for outdoor air pollution, that clear evidence was finally provided of the damage air pollution inflicts on human health at much lower concentrations than previously understood.

October 2025: Oxfordshire County Council introduced a temporary congestion charge to help manage traffic during the extended closure of Botley Road. The short-term traffic measure is designed to reduce congestion, make bus journeys faster, allow for new and improved bus routes, make walking and cycling safer, reduce local air pollution and improve the health of our communities ([link to congestion charge webpage](#)). Traffic filters will replace the congestion charge once Botley Road is reopened to traffic in August 2026.

January 2026: To mark Clean Air Night on 22nd January, Oxford City Council published its [Air Quality Waterways Guidance](#) to support the boating community in Oxford by promoting sustainable and safe practices, particularly around heating and fuel use to improve air quality and protect public health.

February 2026: Oxford City Council approved a new Air Quality Action Plan (2026 – 2030), committing the city to a more ambitious target to protect residents' health and continue driving down air pollution. The new local annual mean (NO₂) target of 20 µg/m³ to be achieved across the city by 2030 aligns with the World Health Organization recommendations as well as latest EU Air Quality Directive ([link to press release](#)).

March 2026: Oxford City Council extended its electric cargo bike delivery partnership for another six months (March – August 2026). Cycle courier Velocity Ltd will continue to support traders in the adoption of sustainable delivery methods. Since its launch in March 2024, the partnership has made around 7,831 deliveries covering approximately 21,926 miles and supporting 27 businesses.

June 2026: Oxford City Council achieved its local annual mean target for NO₂ as set out in the Air Quality Action Plan (2021 – 2025). For the first time ever, all sites of relevant exposure (as per the LAQM guidelines) have seen an NO₂ annual mean below 30 µg/m³.

Conclusions and Priorities

Oxford's 2025 air quality monitoring results show the following:

Nitrogen Dioxide (NO₂)

- NO₂ was monitored at a total of 118 sites in the city in 2025.
- Oxford City Council has met its 2025 local annual mean target of 30 µg/m³, a commitment laid out in the city's AQAP (2021 – 2025) at all sites considered to be of relevant exposure under LAQM.
- Three sites (outside the purview of LAQM monitoring requirements³) were found to be in breach of Oxford's local annual mean target for NO₂ (30 µg/m³). These locations are: Headington Hill (TF19), and Oxford's ring road (TF27 and TF36).
- None one of the 118 sites were found to be in breach of the UK's legal annual mean limit value of 40 µg/m³ for NO₂ in 2025.
- None of the 118 sites is likely to have been in breach of the hourly mean objective⁴ for NO₂ (200µg/m³) – this was the case for the ninth consecutive year.
- In 2025, NO₂ levels decreased (on average) by 5.6% across the city, and by an average of 14% on high bus traffic routes (High Street and St Aldates) when in comparison with the previous reporting year of 2024. 2025 was the first full year in which we have fully seen the positive decrease in air pollution due to the introduction of 159 new electric buses in the city.
- Over the last decade (2015-2025), NO₂ levels have reduced in the city (on average) by 53%, with 26% of those reductions alone occurring since 2021, the year the city launched its previous Air Quality Action Plan 2021-2025⁵.

³ Headington Hill and Oxford's ring roads are not considered a location of relevant exposure (i.e., a location where members of the public are likely to be regularly present for a period of time appropriate to the averaging period of the annual mean limit value). The purpose of monitoring at these locations relates solely with the evaluation of the possible impacts' future interventions (traffic filters) can cause in terms of traffic displacement. They are not subject to our AQAP local annual mean target.

⁴ According to LAQM TG22, only annual means NO₂ that are equal or above 60 µg/m³ represent locations where exceedances of the hourly mean of this pollutant are likely.

⁵ The AQAP 2021 – 2025 has been superseded by the AQAP 2026 – 2030 which was formally adopted in February 2026. The reporting period for the year 2025 relates to the previous AQAP which ran until the end of 2025.

The full 2025 dataset of diffusion tube monthly mean values is provided in Table A.4 in Appendix A.

Particulate Matter (PM₁₀ and PM_{2.5})

PM₁₀ and PM_{2.5} were both monitored by automatic continuous monitors at AURN St Ebbes (urban background) and Oxford High Street (roadside) in 2025.

- The PM₁₀ annual means obtained for these sites were of 10 and 17 µg/m³ respectively. These values are both below the current UK legal annual mean limit of this pollutant (40 µg/m³). St. Ebbes was below the WHO recommended annual mean for PM₁₀ (15 µg/m³) but Oxford High Street was slightly above.
- The PM_{2.5} annual means obtained for these sites were of 7 and 9 µg/m³ respectively. These values are below the current UK legal annual mean limit of this pollutant (10 µg/m³ by 2040) and above the WHO recommended annual mean (5 µg/m³).

Ozone (O₃)

Ozone measurements obtained from the automatic monitor at AURN St Ebbes exceeded the legal air quality objectives for this pollutant 145 times, during a total of 22 days in 2025. AURN St. Ebbes has therefore not met the AQ objectives for this pollutant in 2025.

Priorities for 2026:

Oxford City Council's priorities for the next reporting year are well defined and align with the city's new AQAP (2026 – 2030). During the next reporting year, Oxford City Council and its partners are prioritising:

- The delivery of trial traffic filters in Oxford city to reduce congestion and continue to drive down levels of NO₂ once Botley Road reopens to traffic in August 2026; and
- The updating of the Oxford City Council's Air Quality Planning Guidance.

How to get Involved

One key to changing the current threat of air pollution is educating the communities most impacted by it, providing them with the knowledge that allows them to make more informed choices, not only on how they can reduce their personal exposure to air pollution, but also on how they can contribute to the reduction of air pollution levels in the city.

In September 2023, Oxford City Council (in partnership with all the Districts in Oxfordshire and Oxfordshire County Council) launched the air quality website for Oxfordshire:

[OXONAIR](#).

This platform provides residents and visitors with a wealth of useful information and guidance on Oxford's air quality. It includes access to real-time data from all current air quality monitoring locations, historical data, pollution trends, air quality forecasts, and a free subscription-based alert system. Users can also find updates on the latest air quality projects, as well as access to relevant policy documents, modelling studies, and reports.

Both the City and County Councils are strongly committed to reducing air pollution in the city, and very good progress has been made over the last few years to that regards. However, air pollution is not a problem that the City Council and its partners are able to completely solve on their own - everyone deserves to breathe clean air, but it is important to highlight that everyone also has a role to play in improving air quality levels in the city, as our everyday decisions can have a powerful impact on the air we breathe. Some of the questions to ask ourselves are:

- ✓ Do I burn wood for a nice ambiance or for disposal?
- ✓ Can I pledge to replace a quarter of my car journeys with cycling or public transport?
- ✓ How can I prioritise other ways of getting my children to school like walking, cycling or car sharing?

We all have a huge role to play, and we can all be part of the solution. Encouraging walking and cycling in the city not only has a positive impact on air quality levels, but it also has multiple other benefits, including increasing the health of wellbeing of all those who live, work and visit Oxford.

Other ways of getting involved

- ✓ If you are a teacher or a person responsible for running an environment club or something similar with young people, please have a look at our [Air Quality Toolkit](#) which contains a series of interesting scientific air quality activities (linked with national curricula), and which promote an understanding of the causes and impacts of air pollution with the aim to reduce children's exposure to air pollutants, within the school and through their travel.
- ✓ If you live in an area where idling of car engines is a concern, please have a look at the design resources that Oxford City Council has made available to the general public, and which you can [download and use](#) to run anti-idling campaigns in your local area.

- ✓ Do you have a wood burner, or are you thinking about getting one? Please be aware that the entire administrative area of Oxford has been a [Smoke Control Area](#) since December 2024. Visit our [website](#) to learn more about the health impacts of wood burning and the steps you must follow to use a wood burner in a cleaner, more efficient, and legally compliant way.
- ✓ If you are a boater, have a look at the specific [air quality waterways guidance](#) that we have recently released to help you burn better and breathe better.
- ✓ Look out within your local communities for active groups which have specific interest in air quality matters (ex: [Local Friends of the Earth](#) or [CAG Oxfordshire](#));
- ✓ You can also contact Oxford City Council's air quality team directly at any time for any air quality related matter via the following email: airquality@oxford.gov.uk;

1 Local Air Quality Management

This report provides an overview of air quality in Oxford during 2025. It fulfils the requirements of Local Air Quality Management (LAQM) as set out in Part IV of the Environment Act (1995), as amended by the Environment Act (2021), and the relevant [Policy and Technical Guidance](#) documents.

The LAQM process places an obligation on all local authorities to regularly review and assess air quality in their areas, and to determine whether or not the air quality objectives are likely to be achieved. Where an exceedance is considered likely the local authority must declare an [Air Quality Management Area](#) (AQMA) and prepare an [Air Quality Action Plan](#) (AQAP) setting out the measures it intends to put in place in order to achieve and maintain the objectives and the dates by which each measure will be carried out. This Annual Status Report (ASR) is an annual requirement showing the strategies employed by Oxford City Council to improve air quality and any progress that has been made.

The statutory air quality objectives applicable to LAQM in England are presented in table E.1.

2 Actions to Improve Air Quality

2.1 Air Quality Management Areas

Air Quality Management Areas (AQMAs) are declared when there is an exceedance or likely exceedance of an air quality objective. After declaration, the authority should prepare an Air Quality Action Plan (AQAP) within 18 months. The AQAP should specify how air quality targets will be achieved and maintained and provide dates by which measures will be carried out.

A summary of AQMAs declared by Oxford City Council can be found in Table 2.1. The table presents a description of the AQMA that is currently designated within the city of Oxford. Figure 12: Map of the city's AQMA, provides a map of Oxford's current AQMA and a link to Oxfordshire's air quality website ([OXONAIR](#)), where all the air quality monitoring locations in relation to this AQMA and latest values measured can be found. The air quality objective pertinent to the current AQMA designation is:

- ✓ NO₂ annual mean.
- ✓ NO₂ hourly mean.

Table 2.1 – Declared Air Quality Management Areas

AQMA Name	Date of Declaration	Pollutants and Air Quality Objectives	One Line Description	Is air quality in the AQMA influenced by roads controlled by Highways England?	Highest Concentration: Declaration	Highest Concentration: Current Year	Number of Years Compliant with Air Quality Objective	Name and Date of AQAP Publication	Web Link to AQAP
The city of Oxford	Declared 2010	NO ₂ annual and hourly mean	The whole administrative area of Oxford City Council	YES	78 µg/m ³	28 µg/m ³	<u>NO₂ hourly mean:</u> 9 years <u>NO₂ annual mean:</u> 3 years	AQAP (2026-2030) February 2026	Visit the AQAP for Oxford's city-wide AQMA here

- ☒ Oxford City Council confirm the information on UK-Air regarding their AQMA is up to date.
- ☒ Oxford City Council confirm that all current AQAPs have been submitted to Defra.

2.2 Progress and Impact of Measures to address Air Quality in Oxford

Defra's appraisal of last year's ASR concluded that the evidence provided by Oxford City Council in its latest AQ ASR, and the conclusions reached, were accepted for all sources and pollutants. Oxford was also commended for its robust actions to improve air quality such as:

- Zero Carbon Oxfordshire Partnership
- Air Quality Action Plan 2026 – 2030

Oxford City Council was also commended for having easy to use mapping of monitoring locations.

Oxford City Council has taken forward a number of direct measures during the current reporting year of 2025 in pursuit of improving local air quality.

Details of all 30 measures are included within Table 2.2, with the type of measure and the progress Oxford City Council have made during the reporting year of 2025 presented. Where there have been, or continue to be, barriers restricting the implementation of the measure, these are also presented within Table 2.2.

More detail on these measures can be found in Oxford City Council's [Air Quality Action Plan](#). Key completed measures are:

- Delivery of the city's new Air Quality Action Plan, covering the period 2026 – 2030.
- Continued expansion of the City Council's fleet of electric vehicles.
- Continued progression of the preparation of the ZEZ expansion.
- Continued roll out of EV chargers across the city.
- Implementation of congestion charge at four locations across the city. This will be replaced with traffic filters alongside the reopening of Botley Road, planned for August 2026.

Oxford City Council expects the following measures to be completed over the course of the next reporting year:

- Introduction of trial traffic filters by Oxfordshire County Council.
- To continue the expansion of the City Council's fleet of electric vehicles.
- To continue the roll out of EV chargers across the city.

- The use of the AQ LAT tool and policy scenarios to inform policy and growth ambitions.

Oxford City Council has worked to implement these measures in partnership with the following stakeholders during 2025:

- Neighbouring local authorities (South, Vale, Cherwell and West Oxfordshire District Councils);
- Oxfordshire County Council (The Highways Authority);
- Canal & River Trust;
- Birmingham University;
- Oxford University;
- Oxford Direct Services;
- Ricardo Energy & Environment;
- Velocity Cycle Couriers Ltd

The principal challenges and barriers to implementation that Oxford City Council anticipates facing are:

- The potential for long term lack of central government funding to help local authorities implementing future air quality measures – the fact that DEFRA's Air Quality grant has been paused is an important motive of concern as it may negatively impact the capacity for the City Council to continue to deliver important measures to reduce air pollution at local level in future years.
- The Council is currently operating within a period of significant organisational uncertainty arising from the proposed Local Government Reorganisation (LGR). This presents a particular challenge in relation to the development and delivery of the Air Quality Action Plan for the period 2026–2030. At present, it is unclear whether the City Council will continue to exist as a standalone authority over the lifetime of the forthcoming AQAP, or whether responsibilities for air quality management will transfer to a new or reorganised authority. While the AQAP (2026 – 2030) has been approved and formally adopted, uncertainty remains regarding future governance arrangements and the longer-term role of the City Council in delivering the actions set out within it.

Table 2.2 – Progress on Measures to Improve Air Quality

Measure No.	Measure Title	Category	Classification	Year Measure Introduced in AQAP	Estimated / Actual Completion Date	Organisations Involved	Funding Source	Funding Status	Estimated Cost of Measure	Measure Status	Reduction in Pollutant / Emission from Measure	Key Performance Indicator	Progress to Date	Comments / Barriers to Implementation
Priority Air Quality Actions														
24	Delivery of Oxford Core Transport Schemes (explore opportunities for implementation of Workplace Parking Levy + introduction of Traffic Filters)	Traffic Management	Workplace Parking Levy/ Traffic Filters	2021	2023-2024	Oxford City Council + Oxfordshire County Council	LAs own budgets, Bus Service Improvement Plan (BSIP), future income raised by the WPL	Partially funded	£5-8m (excludes funding for complementary bus and walking and cycling improvements)	Completed	NOx and PM reductions have been estimated here	Traffic counts, numbers of people travelling by bus, cycling, or walking, number of businesses enrolled, enforcement stats. Reduction of NOx, PM ₁₀ and PM _{2.5} concentrations	The Traffic Filters trial is still planned to commence once Botley Road reopens. Botley Road is expected to open in August 2026. As an interim to tackle congestion, the county council implemented a temporary congestion charge . The scheme started on Wednesday 29 October 2025	The project programme is currently being reviewed. Further details, including updated programme will be published on the county council's webpages at the appropriate time: https://www.oxfordshire.gov.uk/residents/workplace-parking-levy
7	Delivery of city-wide campaign on how to implement DEFRA's best practice on the use of open fires and wood burning stoves, and on how to reduce burning of inappropriate fuel	Public Information	Via Leaflets/ Via the Internet/ Via other mechanisms	2021	2022	Oxford City Council + Friends of the Earth+ River Trust	DEFRA AQ Grant	Fully Funded	£45,000	Completed	NOx reduction not estimated, but communication campaigns can increase awareness of up to 12% and behaviour change of up to 6% (Clean Air Day)	Reduction of nuisance complaints, Reduction of NOx, PM ₁₀ and PM _{2.5} concentrations	Oxford City Council published an Air Quality Waterways Guidance supporting the boat dwelling community on best practice for burning	Oxford's ' Do You Fuel Good? ' campaign has been made available here
15	Electrification of Oxford's city bus fleet	Promoting Low Emission Transport	Company vehicle procurement - prioritising uptake of low emission vehicles	2021	2024	Department for Transport (DfT) + Oxfordshire County Council Transport Planning Team + Local bus operators	DfT via Zero Emission Bus Regional Area (ZEBRA) (£32.8m) + Local sus Operators (£43.7m) + Oxfordshire County Council (£6m)	Partially funded	>£10 million	Completed	Oxford's Source Apportionment Study (published in February 2025) estimates a reduction of 28% (from 32% to 4%) in the contribution of buses to the city's total road NOx emissions	Number of buses delivered	The ZEBRA project was completed in December 2024, meaning 2025 was the first calendar year to see the air quality improvements from the base year of 2023 (prior to project delivery)	A comprehensive mixed-methods study was undertaken, led by the University of Birmingham and funded by the National Institute for Health & Care Research (NIHR), with collaboration between transport, climate action and public health colleagues. Electric buses reducing air and noise pollution in Oxford, research suggests Provisional data suggests that bus fleet electrification has reduced roadside citywide nitrogen dioxide (NO ₂) concentrations across Oxford by an average of 10 per cent from 2023 to 2024, and up to 24 per cent in areas of high bus traffic such as St Aldates and High Street
1	Work with schools, vulnerable groups and hard to reach communities to raise awareness of air pollution and promote Active Travel	Public Information + Promoting Travel Alternatives	Student Assemblies + Air Quality campaigns + Promotion of Cycling and Walking	2021	Annually 2021-2025	Oxford City Council + Oxfordshire County Council + Friends of the Earth	Active Travel Fund, LAs annual budget	Fully Funded	< £10k	Completed	NOx reduction not estimated, but increase of up to 23% in walking rates and reduction of up to 30% car journeys was observed with the delivery of the active travel programme WOW + communication campaigns can increase awareness of up to 12% and behaviour change of up to 6% (Clean Air Day)	Number of walking, cycling, scooting, car, and park & stride trips, Number of participating schools and deprived areas and of activities delivered	Community Outreach Active Travel Programme was delivered in 2025 which includes a range of walking and cycling initiatives which help to promote healthy travel behaviours. In 2025, 2277 people in Oxfordshire were reached and supported to walk, ride and wheel for travel, reaching 1000 more people than last year	Some examples of projects include women and children's cycling lessons at Florence Park, bikeability delivered to 45 staff members from Oxford University Hospitals, Joy Riders at Rosehill taught 43 adults and 10 children to cycle, and 14 individuals from Barton and Carfax

Measure No.	Measure Title	Category	Classification	Year Measure Introduced in AQAP	Estimated / Actual Completion Date	Organisations Involved	Funding Source	Funding Status	Estimated Cost of Measure	Measure Status	Reduction in Pollutant / Emission from Measure	Key Performance Indicator	Progress to Date	Comments / Barriers to Implementation
2	Support city-wide events that aim to accelerate the uptake of sustainable transport	Public Information/ Promoting Low Emission Transport/ Freight and Delivery Management	Webinars/ Summits Physical Events	2021	Annually 2021-2025	Oxford City Council + Other Partners (ex: Green TV)	Sponsorship	Fully Funded	Not estimated	Completed	NOx reduction not estimated, but communication campaigns can increase awareness of up to 12% and behaviour change of up to 6% (Clean Air Day)	Total amount of attendees and Businesses participating, number of businesses adopting sustainable delivery options, number of business compliant with the ZEZ	.Go Electric Oxford City was a community event on 1 November in Oxford showcasing EVs, e-bikes, energy efficiency solutions, heat pumps and more	Support is on-going and delivered on an annual basis
3	Support projects that increase Oxford's Air Quality/AQ & Health evidence base	Public Information	Other	2021	Annually 2021-2025	Oxford City Council + Oxfordshire County Council (Public Health/Innovation Teams)	Several types of funding possible (Innovate UK, DEFRA AQ Grant, UKRI)	Partially funded	Not estimated (Successful bids and projects will be added on a regular basis)	Completed	Not directly applicable – NOx reduction not estimated	Total amount of partnerships created; number of AQ/health studies delivered	Oxfordshire County Council completed the air quality modelling project to understand population exposure	The data was fed into the air quality life course assessment tool (AQLAT), a tool that provides health and economic baseline figures and savings from applied air pollution interventions demonstrating local health impacts caused by air pollution
4	Develop partnership work with NHS, commissioners, and providers to increase awareness of air pollution amongst patients and reduce their personal exposure to air pollution	Public Information	Via the Internet/ Via other mechanisms	2021	2021-2025	Oxford City Council + Oxfordshire County Council (Public Health Team)	LAs annual budget	Not funded yet	Not estimated	Completed	NOx reduction not estimated, but communication campaigns can increase awareness of up to 12% and behaviour change of up to 6% (Clean Air Day)	Number of workshops /training sessions delivered, reduction in number of hospital admissions for COPD patients	Oxfordshire County Council has commissioned Cambridge Environmental Research Consultants (CERC) to model interventions for NHS partners	The CERC <u>report</u> has been shared with NHS partners
5	Improve air quality communication on our website and associated websites to assist the public in accessing reliable information about air pollution	Public Information	Via the Internet	2021	Q1 2023	Oxford City Council + all other DCs in Oxfordshire + Oxfordshire County Council	DEFRA AQ Grant	Fully Funded	£162,500	Completed	NOx reduction not estimated, but communication campaigns can increase awareness of up to 12% and behaviour change of up to 6% (Clean Air Day)	Number of website visitors, Number of website downloads, Reduction of public requests for AQ information,	In 2025, there were 12k active users, a 175% increase in users since 2024.	The website has budget allocated for ongoing maintenance
6	Explore opportunities to use green infrastructure to reduce exposure to poor AQ levels	Public Information	Other	2021	2021-2025	Oxford City Council + Oxfordshire County Council + Highways England	LA annual budget + Other sources of funding (still to be identified)	Partially funded	Not estimated (Successful bids and projects will be added on a regular basis)	Completed	Reduction of up to 50% in exposure to air pollution levels where green infrastructure is installed (Greater London Authority)	Air Quality data, number of species planted	Oxford City Council <u>published</u> its Urban Forest Strategy in November 2021. It recognises that the urban forest can help to reduce air pollution. In Oxford, our urban forest is estimated to filter 65 tonnes of airborne pollutants each year	In June 2026 Oxford City Council will publish an updated spatiotemporal Tree Canopy Cover Report which will show canopy cover levels by ward (2009 – 2022)
8	Work with the District and County Councils on a	Public Information	Via Leaflets/ Via the Internet/	2021	2021-2025	Oxford City Council + all other DCs in Oxfordshire +	LAs annual budget	Fully Funded	Staff time only	Completed	NOx reduction not estimated, but communication	Number of campaigns run together between all the	Oxfordshire County Council developed a communication plan last year and	

Measure No.	Measure Title	Category	Classification	Year Measure Introduced in AQAP	Estimated / Actual Completion Date	Organisations Involved	Funding Source	Funding Status	Estimated Cost of Measure	Measure Status	Reduction in Pollutant / Emission from Measure	Key Performance Indicator	Progress to Date	Comments / Barriers to Implementation
	coordinated approach to public awareness and education		Via other mechanisms			Oxfordshire County Council					campaigns can increase awareness of up to 12% and behaviour change	District Councils	has maintained it to enable co-ordinated air quality communications across the county. An Oxon Air LinkedIn page was set up in 2025 to share air quality updates to raise awareness. The page gained 52 followers and 303 organic impressions	
9	Introducing a Euro VI LEZ for buses in Oxford	Promoting Low Emission Transport	Low Emission Zone (LEZ) or Clean Air Zone (CAZ)	2021	2022	Oxford City Council + Oxfordshire County Council + local bus operators	LAs annual budget, CBTF	Fully Funded	Staff time only	Withdrawn	Estimated reductions of between 5% to 12.8% of total city Road NOx emissions (Ricardo's Source Apportionment Study)	LEZ Euro VI Approved bus database	This measure has been superseded by AQAP measure 15	
10	Introducing Ultra Low emission standards for Hackney Carriage Vehicles	Promoting Low Emission Transport	Taxi Licensing conditions	2021	2025	Oxford City Council	LAs annual budget	Fully Funded	Staff time only	On Hold	Up to 0.1% total city Road NOx emissions (From Ricardo EE's latest source Apportionment Study – February 2025)	Amount of New HCV Applications, enforcement stats	Oxford City Council agreed to postpone the introduction of the final ULEV new emission standards for Hackney Carriage Vehicles until 2028 to align with Local Government Reorganisation (LGR)	You can find the decision here
11	Delivery of Zero Emission Zone (measures to incentivise zero emission vehicles or place restrictions on other vehicles in Oxford)	Promoting Low Emission Transport/ Traffic Management	Low Emission Zone (LEZ) or Clean Air Zone (CAZ) / Road User Charging (RUC)/ Congestion charging	2021	2021-2025	Oxford City Council + Oxfordshire County Council	LAs annual budget, DEFRA AQ Grant and other sources of funding	Partially Funded	ZEZ Pilot - £267,400	Completed	recorded NO ₂ reductions of up to 18% on the affected streets ZEZ Pilot evaluation monitoring report published here	Behavioural responses, AQ monitoring, ANPR counts	The city centre ZEZ Pilot was launched on 28th February 2022. Details of this now active scheme can be found here	A consultation for the ZEZ expansion is expected in spring 2026
12	Increase the amount of EV charging infrastructure in the City.	Promoting Low Emission Transport	Procuring alternative Refuelling infrastructure to promote Low Emission Vehicles, EV recharging.	2021	2021-2025	Oxford City Council + Oxfordshire County Council	Innovate UK, AQ DEFRA Grant, OLEV Grant scheme, LAs budget	Fully Funded	Not estimated	Completed	NOx reduction not estimated	Number of EV Chargers Installed	The Local EV Infrastructure (LEVI) fund was successfully bid for. Identified sites are moving into feasibility and will be delivered by autumn	The LEVI procurement process, including the tendering evaluation and contract award stages took longer than anticipated and delayed the start of installations
13	Expansion of City Council's EV Fleet (Electrification of 25% of vehicle fleet)	Promoting Low Emission Transport	Company Vehicle Procurement - Prioritising uptake of low emission vehicles	2021	2023	Oxford City Council	Innovate UK, LAs annual budget	Fully Funded	Not estimated	Completed	NOx reduction not estimated	Number of Electric vehicles purchased	Oxford Direct Services (ODS) added 159 vehicles to its fleet between 2021 and 2025	35% of the total fleet is now EV
14	Development of an EV Strategy for Oxfordshire	Policy Guidance and	Other Policy	2021	2021	Oxfordshire County Council + other DCs	LAs own budget	Fully Funded	Not estimated	Completed	NOx reduction not estimated	Publication of EV strategy and adoption of Strategy by all	Oxfordshire EV Infrastructure Strategy (OEVIS)	Oxford City Council has also published in July 2022 an EV strategy specific for the city of Oxford, which sets out EV infrastructure targets for 2026, 2030, and 2040 to meet our Net Zero targets. This

Measure No.	Measure Title	Category	Classification	Year Measure Introduced in AQAP	Estimated / Actual Completion Date	Organisations Involved	Funding Source	Funding Status	Estimated Cost of Measure	Measure Status	Reduction in Pollutant / Emission from Measure	Key Performance Indicator	Progress to Date	Comments / Barriers to Implementation
		Development Control										District Councils	was adopted and published	includes metrics for ensuring car clubs are situated in city car parks to encourage the move away from car ownership, residential electric charging to stay in step with the increase in EV ownership and the move to electric for the council fleet
16	Delivery of Oxford's Energy Super Hub	Promoting Low Emission Transport/ Promoting Low Emission Plant	Procuring alternative Refuelling infrastructure to promote Low Emission Vehicles, EV charging. Replacement of combustion sources	2021	2022	Oxford City Council + Partners	Innovate UK	Fully Funded	£41 million	Completed	10,000 tonnes of CO ₂ per year saving by 2021, rising to 25,000 tonnes per year by 2032 + up to 22% reduction of NO ₂ emissions from transport by 2032	Number of EV chargers and Ground Source Heat Pumps (GSHP) installed, number of EVs purchased, AQ monitoring	Oxford City Council delivered 42 new fast and ultra-rapid charging points (powered entirely by renewable energy)	All relevant info about this project can be found at the ESO website here
17	Delivery of Air Quality Benefits through Planning System (Reduce amount of car parking in the city + increase EV charging infrastructure + require more efficient/less pollutant domestic heating technologies)	Policy Guidance and Development Control	Air Quality Planning and Policy Guidance/ Other Policy	2021	Annually 2021-2025	Oxford City Council	LAs own budget	Fully Funded	Not estimated	Completed	NOx and PM reductions not estimated	Number of developments with EV chargers /number of EV chargers installed number of Planning conditions discharged	Already being delivered through Oxford's Local Plan. New air quality policies under Oxford's proposed new local plan 2040 include the obligation of developers to comply with the city's current and future local annual mean targets for NO ₂ .	
18	Delivery of eco-moorings (electric bollards) at the visitor moorings in Aristotle Lane	Promoting Low Emission Transport + Promoting Low Emission Plant	Other Policy	2021	2024	Oxford City Council (Environmental Sustainability Team) + Canal & River Trust	DEFRA Air Quality Grant	Fully Funded	£100k - £500k	Completed	Reduced NOx and PM _{2.5} emissions from diesel generators and wood burning	Electricity usage Number of boats using eco-moorings Number of smoke complaints	On the 23rd May 2025, Oxford City Council and the Canal and River Trust delivered six "eco-moorings" at the towpath visitors' moorings of Aristotle Lane, on the Oxford Canal. The power points at these moorings can now provide electric power for up to six visiting boaters to reduce their reliance on diesel engines, generators and wood burners for their day-to-day energy needs	The sockets have range of capacity, with five 16-amp sockets and one 32-amp socket which will support the charging of electric propulsion boats (e-boats) All sockets will also have the capability to become 32-amp in the future, based on demand
19	Upgrade Energy Efficiency of City Council's Housing stock	Promoting Low Emission Plant	Other Policy	2021	Annually 2021-2025	Oxford City Council	LAs own budget	Partially funded	Not estimated	Completed	NOx and PM reductions not estimated	Number of boiler upgrades, insulations and high efficiency storage heaters installed per year	From April 2025 – March 2026, 11 Air Source Heat Pumps (ASHPs) were installed and 438 boilers have been upgraded, funded through HRA. We also had 281 insulation upgrades in 2025	Access to properties and refusals continue to be the major barrier to the roll out of retrofit in the Council's housing stock

Measure No.	Measure Title	Category	Classification	Year Measure Introduced in AQAP	Estimated / Actual Completion Date	Organisations Involved	Funding Source	Funding Status	Estimated Cost of Measure	Measure Status	Reduction in Pollutant / Emission from Measure	Key Performance Indicator	Progress to Date	Comments / Barriers to Implementation
													funded by SHDF 2.1	
20	Provide Energy advice services: employ Energy advice Officers to visit Council homes and advise tenants, whilst also identifying energy saving improvements to the properties	Promoting Low Emission Plant	Other Policy	2021	Annually 2021-2025	Oxford City Council	LAs own budget	Fully Funded	Not estimated	Completed	NOx and PM reductions not estimated	Total amount of home visits and of energy savings per year	From 1st November 2024 - 1st October 2025 Better Housing Better Health conducted 432 warm and well assessments as well as 107 home visits in Oxford. BHBH have also had 180 partner referrals into BHBH, 205 new incomes identified, 235 energy supplier/tariff enquiries and 42 energy efficiency referrals	In house energy advice services for our own tenants are no longer resourced. City Council tenants and all residents in Oxford can access the BHBH service which provides free energy and cost of living advice
21	Use of central government's ECO Flexible Eligibility funding to identify and designate households as eligible under the Affordable Warmth Scheme	Promoting Low Emission Plant	Other Policy	2021	Annually 2021-2025	Oxford City Council	ECO Flexible Eligibility funding	Partially funded	Not estimated	Completed	NOx and PM reductions not estimated	Total amount of households being granted with energy efficiency improvements	In 2025/2026 financial year the City Council signed 35 declarations for ECO4 Flex. A further 13 properties (3 still in progress) benefited from the Home Upgrade Grant (HUG2) Scheme which saw 43 retrofit measures including: solar PV, Cavity Wall Insulation, Ventilation, Loft Insulation, ASHP, Wet Central Heating, Heating Controls installed. In 2025 the Warm Homes Local Grant resulted in 4 installations of retrofit measures	The main barriers to the uptake of ECO Flex remain the same, mainly due to lack of installers and overly complicated application process. The scheme has been extended until December 2026 for installers to complete ongoing works, but we are not accepting any new applications. To address these barriers Oxford City Council has been promoting these schemes as well as the recently launched Warm Homes: Local Grant funding
22	Implementation of a new city-wide Smoke Control Order	Promoting Low Emission Plant	Other Policy	2021	2024	Oxford City Council (Environmental Sustainability and Regulatory Services Teams)	DEFRA (via Air Quality New Burdens Smoke Control Areas grant (£11,710 x3) + Oxford City Council's own budget	Partially Funded	£10k - £50k	Completed	PM reductions not measured yet given the fact that its only in place for 4 months – Effective air quality impacts expected to be measured over the next reporting period	Reduction of the amount of nuisance complaints	The new city-wide Smoke Control Area has been in place since 1 st December 2024	
23	Encourage the development of local heat networks	Promoting Low Emission Plant	Other Policy	2021	Annually 2021-2025	Oxford City Council	LAs own budget	Fully Funded	Not estimated	Completed	NOx and PM reductions not estimated	Number of planning applications using heat networks	Preliminary Market Engagement is ongoing to scope market interest in the development and delivery of HNs in the city	If a District Heat Network is developed, successful, it could provide low or zero carbon heat to major heat users in Oxford, providing a key deliverable of the Zero Carbon Oxford Action Plan and removing a large number of gas boilers, supporting air pollution targets

Measure No.	Measure Title	Category	Classification	Year Measure Introduced in AQAP	Estimated / Actual Completion Date	Organisations Involved	Funding Source	Funding Status	Estimated Cost of Measure	Measure Status	Reduction in Pollutant / Emission from Measure	Key Performance Indicator	Progress to Date	Comments / Barriers to Implementation
25	Delivery of sustainable transport measures such as cycling improvements and bus priority lanes	Transport Planning and Infrastructure/ Traffic management	Cycle network/ Bus priority	2021	2021-2025	Oxford City Council + Oxfordshire County Council	DfT Active Tranche 2 & Growth Deal	Fully funded	£44m approx. for sustainable transport schemes on three Oxford radial routes and other locations	Completed	NOx and PM reductions not estimated	Local cycling and walking infrastructure plans (LCWIP) 50% increase by 2030 (Active Lives Survey)	In 2025/26, funding was secured to support the design and delivery of a range of active travel and public realm improvements across Oxford, including corridor schemes, city centre enhancements, neighbourhood measures, and cycle parking. Safety improvements to walking and cycling infrastructure have been delivered through targeted programmes, with upgrades such as new crossings, traffic calming, and footway interventions	Ongoing maintenance schemes have also improved the quality of cycle infrastructure on key routes across the city. Feasibility work has been completed to support future delivery of area-wide walking and cycling improvements, while options development and implementation of road safety measures on strategic routes and side roads is progressing through dedicated safety funding programmes
26	Roll-out of Controlled Parking Zones (CPZ) and Low Traffic Neighbourhoods (LTN)	Traffic Management	Traffic reduction	2021	2021-2023	Oxfordshire County Council	Department for Transport (Emergency Active Travel Fund); LAs own budget	Fully Funded	£1m approx. for CPZs £311,000 for LTNs	Completed	NOx and PM reductions measured	Implementation of the new CPZs and LTNs	Iffley Controlled Parking Zone was approved in November 2024 and became operational in February 2025	Funded by Oxford City Council's Community Infrastructure Levy, the county council is currently undertaking a review of seven existing CPZs across the city consultation. As part of these reviews, the county council will be updating parking restrictions including providing additional kerbside space for cycle and hire e-bike and e-scooter parking, and for car club vehicles
27	Work with businesses to explore the inclusion of innovative sustainable travel modes into their current business models	Freight and Delivery Management	Delivery and Service plans/ Freight Partnerships for city centre deliveries	2021	Annually 2021-2025	Oxfordshire County Council + Oxford City Council	DEFRA AQ Grant; LAs own budget, Energy Saving Trust	Partially funded	Not estimated	Completed	NOx and PM reductions not estimated	Number of businesses adopting sustainable travel modes	In March 2026, Oxford City Council extend for another 6 months its partnership with Velocity Cycle Couriers to continue to offer to Oxford businesses same-day and next-day zero-emission deliveries by electric cargo bike to destinations within the ring road Under the partnership, businesses can book deliveries to be carried out by a Velocity rider using the dedicated Oxford's Covered Market e-cargo bike, supported by Velocity's fleet of e-cargo bikes	The contract will run from March until August 2026

Measure No.	Measure Title	Category	Classification	Year Measure Introduced in AQAP	Estimated / Actual Completion Date	Organisations Involved	Funding Source	Funding Status	Estimated Cost of Measure	Measure Status	Reduction in Pollutant / Emission from Measure	Key Performance Indicator	Progress to Date	Comments / Barriers to Implementation
													Oxford City Council subsidises 50% of each delivery, with participating businesses paying the remaining cost. This subsidy has allowed the partnership to continue for as long as possible, enabling businesses to continue to explore zero emission deliveries for longer	
28	Explore opportunities for implementation of consolidation centre to address city centre freight emissions	Freight and Delivery Management	Freight Consolidation Centre	2021	2026	Oxfordshire County Council + Oxford City Council+ Oxford University	LAs annual budget, and other sources of funding, Horizon Europe/Innovate UK	Partially funded	Not estimated (pending feasibility)	Completed	NOx reduction not estimated	estimated CO2 savings; parcels delivered by cargo bike per day by m2 of consolidation hub; number of businesses enrolled	Oxfordshire County Council trialled a Mini Consolidation Hub at Oxford Parkway to support Pedal & Post cargo-bike deliveries into North Oxford, with operations starting in December; Pedal & Post has since entered liquidation and the hub has been decommissioned, and P&P delivery data will be used to compare depot- and hub-based operations	
29	Work with schools to reduce exposure to air pollution by reducing the need to travel during drop off/pick up times (ex: School Streets)	Alternatives to private vehicle use/ Promoting Travel Alternatives	Other	2021	2025	Oxfordshire County Council	Active Travel fund for LAs in England	Partially funded	£60,000 approx. for School Streets	Completed	NOx reduction not estimated	Number of streets closed; schools enrolled	School Streets: • Tyndale Primary School Street trial began on 13/05/24 with ANPR Camera intervention made permanent from January 2025 • Sandhills Primary School Street trial began on 04/06/24 with ANPR Camera intervention made permanent from January 2025. Extension of school street approved, implementation likely to take place in May • St Mary and St John Primary School Street trial began on 13/05/24 with ANPR Camera intervention made permanent from January 2025 • New Hinksey School Street trial began on 04/06/24 with ANPR Camera	• A formal review for phase 2 school streets has not yet been reported however University of Birmingham completed a review of phase 1 and found school streets reduced NO2 concentrations during peak school times when children's exposure is highest. The strongest improvements were seen at St. Ebbes Primary School where concentrations fell by around 50 % during restricted periods, exceeding reductions seen at nearby urban background monitoring sites, indicating a clear local intervention effect

Measure No.	Measure Title	Category	Classification	Year Measure Introduced in AQAP	Estimated / Actual Completion Date	Organisations Involved	Funding Source	Funding Status	Estimated Cost of Measure	Measure Status	Reduction in Pollutant / Emission from Measure	Key Performance Indicator	Progress to Date	Comments / Barriers to Implementation
													intervention made permanent from January 2025 • Continuing to engage with a number of schools on potential future active travel initiatives, including school streets and school zones	
30	Support Bikeability (free cycling lessons provided to pupils)	Promoting Travelling alternatives	Promotion of Cycling	2021	2021-2025	Oxfordshire County Council	DfT via The Bikeability Trust charity	Partially funded	Not estimated	Completed	NOx reduction not estimated	Number of schools enrolled	Bikeability continues to be rolled out to schools across the county	

2.3 PM_{2.5} – Local Authority Approach to Reducing Emissions and/or Concentrations

As detailed in Policy Guidance LAQM.PG22 (Chapter 8) and the Air Quality Strategy⁶, local authorities are expected to work towards reducing emissions and/or concentrations of fine particulate matter (PM_{2.5}). There is clear evidence that PM_{2.5} (particulate matter smaller 2.5 micrometres) has a significant impact on human health, including premature mortality, allergic reactions, and cardiovascular diseases.

According to the city's latest source apportionment [study](#) (published in February 2025, and which includes data from the [National Atmospheric Emissions Inventory](#) – NAEI 2022), domestic combustion is the sector that contributes the most to total PM_{2.5} emissions in the city, with domestic wood burning, contributing to a staggering 70% of those emissions within that sector.

In Oxford, PM_{2.5} is measured at two automatic monitoring locations within the city: AURN St Ebbes (Urban Background) and Oxford High Street (Roadside site). In 2025, AURN St Ebbes and Oxford High Street measured PM_{2.5} annual means of 7 and 9 µg/m³ respectively. These results are below the UK's PM_{2.5} national annual mean limit value of 10 µg/m³ (which was introduced by the Environment Act 2021 and needs to be achieved by all local authorities in the UK by 2040) and are just slightly above WHO's recommended PM_{2.5} annual mean guidance level of 5 µg/m³ (considered to be the safest level to date to human health).

Oxford City Council considers that many of the measures designed to reduce levels of nitrogen dioxide set out in the city's current AQAP will also contribute to reducing levels of PM_{2.5}, and the City Council will always continue to develop AQAPs that include air quality measures that can contribute to a reduction of local PM_{2.5} emissions.

⁶ Defra. Air Quality Strategy – Framework for Local Authority Delivery, August 2023

In December 2024, the entire administrative area of the city of Oxford became a Smoke Control Area (SCA). This was a very important step for reducing local PM_{2.5} emissions associated with the burning of poor quality and unauthorised fuels. In 2025, Oxford City Council had 2 smoke nuisance investigations coming from residential chimneys, 4 coming from residential canal boats, and 60 service requests for bonfires.

In 2025, Oxfordshire County Council acquired the Air Quality Life-course Assessment Tool (AQLAT) from the University of Birmingham. This initiative, jointly funded by the five districts in Oxfordshire and the county council, will integrate county-wide air quality modelling with the AQLAT tool. This integration aims to provide detailed health and economic benefits of reducing air pollution at a ward-level resolution.

Figure 1 shows the results from the AQLAT tool. This tool utilises high-resolution modelled air pollution data⁷ and indicates that the annual health burden attributable to air pollution in Oxford includes up to 63 early deaths, 12 strokes, 53 cases of asthma, 5 cases of lung cancer, and 22 cases of heart disease. The burden on the NHS was estimated to be £259,000, the productivity costs £72,000 and the social care costs £127,000.

Several interventions were modelled and the health and economic savings were calculated. These insights will support evidence-based decision-making and targeted interventions to improve air quality and public health outcomes in Oxford.

Air quality and its health impacts are not experienced equally, with poorer communities facing disproportionate exposure and outcomes. As a Marmot Place, Oxfordshire is committed to reducing these inequalities, with a particular focus on giving children the Best Start in Life. Our action plan therefore includes measures that aim to reduce children's exposure to air pollution in the most affected areas. Oxfordshire County Council created a map that identified populations most vulnerable to air pollution to enable targeted interventions to address health inequalities. The middle-layer super output areas (MSOAs) deemed to be most vulnerable to air pollution are shown

Figure 1 - AQLAT modelled beta results of the health burden to air pollution in Oxford

Commented [CM1]: Melissa to update the infographic below.

⁷ https://www.oxfordshire.gov.uk/sites/default/files/file/environment-and-planning/FM1488_CERC_Oxfordshire_B5_09Jan26.pdf

Figure 2 - Oxfordshire County Council air quality vulnerability map⁸

⁸ The air quality vulnerability map scores areas that are most vulnerable to air pollution with 1 being the most vulnerable (yellow) and 10 (dark blue) being least vulnerable. The map used modelled air pollutant data, AQLAT data, deprivation data (general population, children and older people), hospital admissions for asthma, and vulnerable setting counts for schools, childcare, care homes, community centres, hospitals and GPs.

Oxfordshire's air quality website (OXONAIR) also shows the latest Defra modelled map of the annual mean PM_{2.5} levels for Oxford (year 2024)⁹.

Figure 3 - Modelled map of annual mean concentrations for PM_{2.5} in Oxford (2024)

The Public Health Outcomes Framework provides a list of indicators that provide useful insight on how well public health is being improved and protected and concentrates on two high-level outcomes (healthy life expectancy and differences in life expectancy and healthy life expectancy between communities) to be achieved across the public health system. The latest version of this framework was published in February 2025 and present useful air quality metrics for the year 2023. It estimates that in Oxford, 5.3% of deaths from all causes in those aged 30+ are attributable to PM_{2.5} alone.

Like what has been observed in previous years, Oxford's performance is, in general, worse when compared to other district councils in Oxfordshire for these types of indicators. Given the fact that air pollution tends to be much higher in highly urban areas compared to

⁹ The latest available modelled maps on OXONAIR are for the year 2024. The modelled maps for the year 2025 will only be made available later in 2026.

the rest of Oxfordshire, which is much more rural in nature, this should not come as a surprise.

While the Public Health Outcomes Framework provides valuable data on air quality and health, it is not the only source. [The Oxfordshire Data Hub](#) - hosted by the County Council - is a publicly accessible platform offering a wide range of data and intelligence about Oxfordshire. It serves as a go-to resource for detailed information on Oxford City, including population, health, deprivation, environment, and more.

DRAFT

3 Air Quality Monitoring Data and Comparison with Air Quality Objectives and National Compliance

This section sets out the monitoring undertaken within 2025 by Oxford City Council and how it compares with the relevant air quality objectives. In addition, monitoring results are presented for a five-year period between 2021 and 2025 to allow monitoring trends to be identified and discussed.

3.1 Summary of Monitoring Undertaken

3.1.1 Automatic Monitoring Sites

Oxford City Council undertook automatic (continuous) monitoring at 3 sites during 2025. Table A.1 in Appendix A shows the details of the automatic monitoring sites. One of our automatic sites was offline for six months of the year while the Oxford Town Hall was under renovations (Oxford Centre Roadside). The [OxonAir](#) page presents automatic monitoring results for Oxford City Council, with automatic monitoring results also available through the UK-Air website .

Maps showing the location of the monitoring sites are provided in Figure 13 of Appendix D. Further details on how the monitors are calibrated and how the data has been adjusted are included in Appendix C.

3.1.2 Non-Automatic Monitoring Sites

Oxford City Council undertook non- automatic (i.e. passive) monitoring of NO₂ at 118 sites during 2025 Table A.2 in Appendix A presents the details of the non-automatic sites.

Maps showing the location of the monitoring sites are provided [here](#). Further details on Quality Assurance/Quality Control (QA/QC) for the diffusion tubes, including bias adjustments and any other adjustments applied (e.g. annualisation and/or distance correction), are included in Appendix C.

For the purposes of deciding which locations to monitor, the City Council considers in the first instance locations where there is relevant public exposure. It is important that assessments focus on locations where members of the public are likely to be regularly present for a period of time appropriate to the averaging period of the objective. Monitoring is carried out in line with DEFRA's Technical Guidance LAQM.TG22.

Approximately half of the monitoring locations are within central Oxford at locations where the City Council believes relevant exposure is most likely to be significant. The remaining locations are outside of the central area, again prioritised by locations where relevant exposure is most likely.

The monitoring of NO₂ via diffusion tubes, cannot be undertaken at every location on a continuous basis. The City Council therefore makes the most of available resources by implementing a rotational system on a percentage of monitoring sites every year, ensuring such sites are covered on average every 2 to 3 years.

One important aspect of monitoring is to be able to demonstrate trends in air quality over long time periods. To do so, the City Council continues monitoring at several of the same sites' year on year, so that the results reported can show long-term temporal trends.

3.2 Individual Pollutants

The air quality monitoring results presented in this section are, where relevant, adjusted for bias, annualisation (where the annual mean data capture is below 75% and greater than 25%), and distance correction. Further details on adjustments are provided in Appendix C.

3.2.1 Nitrogen Dioxide (NO₂)

In 2025, NO₂ was monitored at three locations in Oxford using automatic continuous monitors and at 117 locations using passive monitoring (diffusion tubes).

The UK's annual mean air quality objective for NO₂ is 40 µg/m³.

In 2025, Oxford High Street measured annual mean for NO₂ was of 17 µg/m³. At AURN Oxford Centre Roadside saw an annual mean of 21 µg/m³, and AURN St Ebbes was 11 µg/m³. This objective was therefore met at all automatic monitoring stations in 2024.

Table A.3 and Table A.4 in Appendix A compare the ratified and adjusted monitored NO₂ annual mean concentrations for the past five years with the air quality objective of 40µg/m³. Note that the concentration data presented represents the concentration at the location of the monitoring site, following the application of bias adjustment and annualisation, as required (i.e. the values are exclusive of any consideration to fall-off with distance adjustment).

For diffusion tubes, the full 2025 dataset of monthly mean values is provided in Appendix B. Note that the concentration data presented in Table B.1 includes distance corrected values, only where relevant.

Table A.5 in Appendix A compares the ratified continuous monitored NO₂ hourly mean concentrations for the past five years with the air quality objective of 200µg/m³, not to be exceeded more than 18 times per year. Figure 4 below shows the 20-year long term trend for levels of measured NO₂ at Oxford's three automatic monitoring stations. The results are expressed in µg/m³

DRAFT

Figure 4 - Long term trends of annual mean NO₂ of Oxford's automatic monitoring sites, 2004-2025

Figure 3 shows that overall, the NO₂ levels measured in Oxford at the locations of our automatic monitoring sites have decreased since 2004.

2025 was the first full calendar year following the completion of the Zero Emission Bus Regional Area (ZEBRA) scheme. This means that the air quality benefits associated with the electric buses are now considered to be evident, and the reduction in NO₂ levels recorded at both of Oxford's automatic roadside monitoring stations can be largely attributed to the introduction of 150 fully electric buses which now account for approximately 69% of the city's total bus mileage.

The electric bus rollout was made possible by a successful £32.5 million funding bid submitted by Oxfordshire County Council, in collaboration with local bus operators Oxford Bus Company and Stagecoach. The funding was awarded by the Department for Transport (DfT) in March 2022 under the ZEBRA scheme.

In 2025, the NO₂ levels measured at Oxford Centre Roadside fell by 8.7% whilst Oxford High Street fell by 19%. This reduction further demonstrates the positive environmental impact of transitioning to a cleaner bus fleet.

For detailed information on time variations, daily means, and basic statistics of NO₂ at Oxford's three automatic monitoring stations please refer to Appendix F.

The AQ objective for hourly mean NO₂ concentration is 200 µg/m³ and may be exceeded up to 18 times per calendar year. The time series of hourly averaged concentrations of NO₂ for the 3 automatic monitoring sites is compared against the UK's legal hourly mean limit value (dashed red line) in Figure 5 below. The results are expressed in µg/m³.

Table A.5 in Appendix A compares the ratified continuous monitored NO₂ hourly mean concentrations for the past five years with the air quality objective of 200µg/m³, not to be exceeded more than 18 times per year.

Figure 5 – Time series of hourly averaged concentrations of NO₂ at Oxford's automatic monitoring sites, 2025

None of the three automatic monitoring sites had any exceedances of the hourly mean NO₂ limit value (200 µg/m³) in 2025. NO₂ at all 3 sites were always recorded within the DEFRA “Low” Air Quality band in 2025.

NO₂ Results from the non-automatic monitoring (diffusion tubes)

The main observations of the monitoring carried out in 2025 using non-automatic monitoring are as follow:

- NO₂ was monitored at a total of 118 sites in the city in 2025.
- Oxford City Council has met its 2025 local annual mean target of 30 µg/m³, a commitment laid out in the city’s AQAP (2021 – 2025) at all sites considered to be of relevant exposure under LAQM.
- Three sites (outside the purview of LAQM monitoring requirements¹⁰) were found to be in breach of Oxford’s local annual mean target for NO₂ (30 µg/m³). These locations are: Headington Hill (TF19), and Oxford’s ring road (TF27 and TF36).
- None one of the 118 sites were found to be in breach of the UK’s legal annual mean limit value of 40 µg/m³ for NO₂ in 2025.
- None of the 118 sites is likely to have been in breach of the hourly mean objective¹¹ for NO₂ (200µg/m³) – this was the case for the ninth consecutive year.
- In 2025, NO₂ levels decreased (on average) by 5.6% across the city, and by an average of 14% on high bus traffic routes (High Street and St Aldates) when in comparison with the previous reporting year of 2024. 2025 was the first full year in which we have fully seen the positive decrease in air pollution due to the introduction of 159 new electric buses in the city.

¹⁰ Headington Hill and Oxford’s ring roads are not considered a location of relevant exposure (i.e., a location where members of the public are likely to be regularly present for a period of time appropriate to the averaging period of the annual mean limit value). The purpose of monitoring at these locations relates solely with the evaluation of the possible impacts’ future interventions (traffic filters) can cause in terms of traffic displacement. They are not relevant to our AQAP local targets.

¹¹ According to LAQM TG22, only annual means NO₂ that are equal or above 60 µg/m³ represent locations where exceedances of the hourly mean of this pollutant are likely.

- Over the last decade (2015-2025), NO₂ levels have reduced in the city (on average) by 52%, with 26% of those reductions alone occurring since 2021, the year the city launched its previous Air Quality Action Plan 2021-2025¹².

DRAFT

3.2.2 Particulate Matter (PM₁₀ and PM_{2.5})

In 2025, PM₁₀ and PM_{2.5} data were monitored by automatic continuous monitors at Oxford High Street and AURN St Ebbes. Table A.6 in Appendix A: Monitoring Results compares the ratified and adjusted monitored PM₁₀ annual mean concentrations for the past five years with the air quality objective of 40µg/m³. Table A.7 in Appendix A compares the ratified continuous monitored PM₁₀ daily mean concentrations for the past five years with the air quality objective of 50µg/m³, not to be exceeded more than 35 times per year.

In 2025, Oxford High Street (roadside) registered a PM₁₀ annual mean of 17 µg/m³. AURN St. Ebbes (urban background) of 10 µg/m³. The annual mean PM₁₀ concentration tends to be slightly higher at roadside sites, when compared to urban background sites, due to the contribution of PM₁₀ emissions from road transport sources, predominantly from non-exhaust sources (brakes, tyres, and road wear), as well as the impact of resuspension due to vehicle movements.

The annual mean AQ objective for PM₁₀ is 40 µg/m³. This objective was fully met at both monitoring sites in 2025. There was a slight increase in PM₁₀ monitored at both sites compared to 2024, with Oxford High Street increasing from 13 µg/m³ and AURN St. Ebbes increasing from 9 µg/m³.

The UK legal target for PM_{2.5} requires for a maximum annual mean concentration of 10 µg/m³ to be achieved by 2040, with a new interim target of 12 µg/m³ expected to be achieved by the end of January 2028.

The monitored annual mean of PM_{2.5} that was obtained in 2025 was of 9 µg/m³ at Oxford High Street and of 6 µg/m³ at AURN St. Ebbes. These annual means are very similar, both of them are in compliance with the new UK air quality target and relatively close to the annual mean of the 5 µg/m³ which is recommended by WHO guidelines for this pollutant.

As observed with PM₁₀, there was a slight increase in PM_{2.5} annual mean concentrations at both monitoring locations, with Oxford High Street increasing from 7 µg/m³ and AURN St. Ebbes increasing from 6 µg/m³.

The observed increase in both PM₁₀ and PM_{2.5} in 2025 is likely driven by regional and transboundary sources rather than local emissions at the start of the year. For example, from January to March 2025, data from both Oxford monitoring sites shows short-term spikes that closely correspond with elevated PM₁₀ and PM_{2.5} episodes recorded in

London. London authorities state the “Very High PM_{2.5} and PM₁₀ pollution episode on 10th March”:

*“Corresponded with the **arrival of air that had passed at low altitude over large areas of Europe**, accumulating pollution from urban, industrial, and agricultural sources enroute. At a similar time, wind speeds dropped locally, resulting in poor dispersion of locally generated emissions and allowed a build-up of the imported particulate pollution.”*

It is likely that the episodes seen at the start of the year contributed to an overall increase in annual mean concentrations for both pollutants. Figures 6 – 9 below show similar spikes simultaneously in Oxford as in London.

Figure 10 and Figure 11 show the long-term trends of PM₁₀ and PM_{2.5} concentrations measured at Oxford High Street and AURN St. Ebbes.

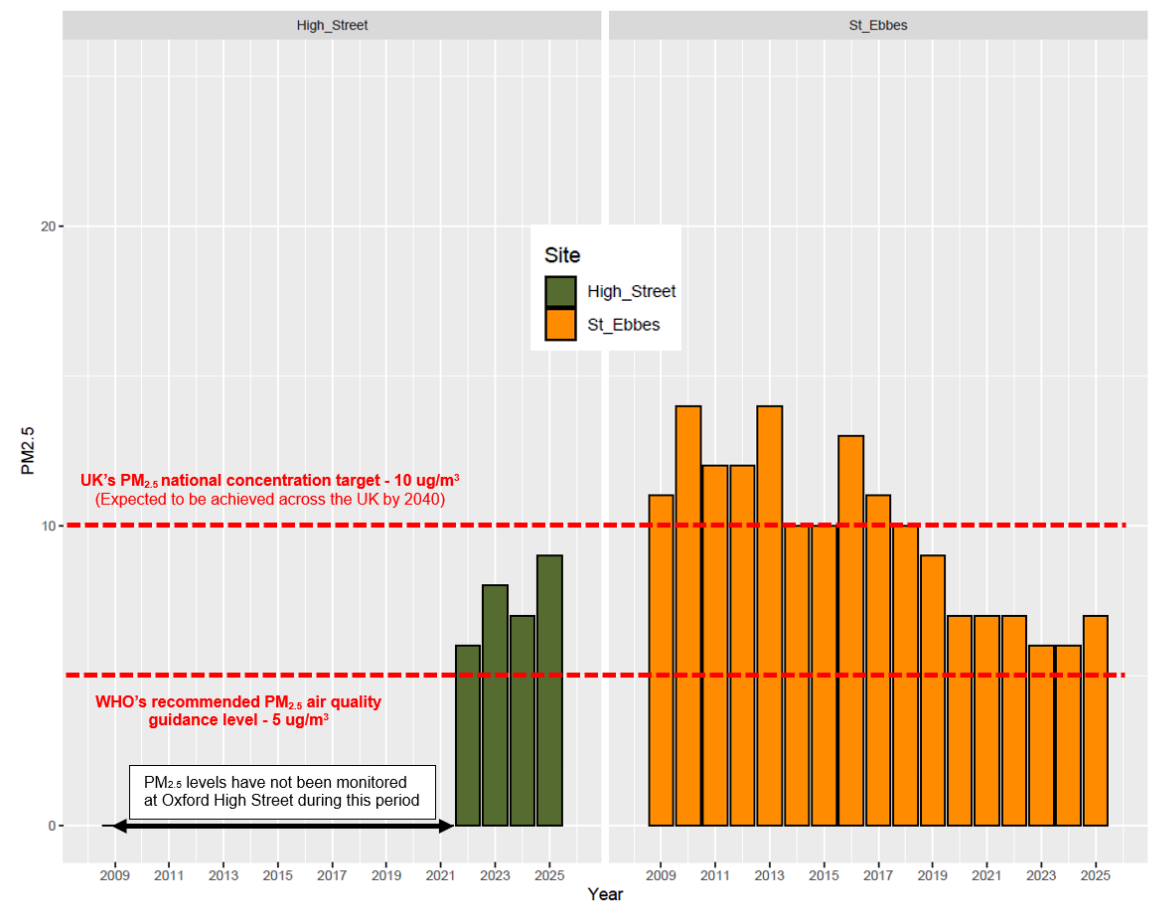

Figure 11 - Long term trends in annual mean PM_{2.5} at Oxford's continuous monitoring stations, 2009 - 2025

3.2.3 Ozone

In Oxford, O₃ is measured at AURN St. Ebbes. The UK's Air Quality objective for daily maximum on an 8-hour running mean is 100 µg/m³ not to be exceeded more than 10 days a year.

The data capture of O₃ at AURN St. Ebbes in 2025 was of 99.4%.

In 2025, this site exceeded the AQ daily objective for ozone 145 times, during a total of 22 days during the year. AURN St. Ebbes has not met the AQ objectives for this pollutant in 2025.

The highest concentrations measured in 2025 were 143 µg/m³.

OXONAIR's [page](#) registers the biggest air pollution episodes affecting Oxfordshire, and makes note of increased ozone pollution recorded for 21 days from April to August 2025.

According to the report, these ozone pollution peaks were linked to:

*"Air arriving from **northern Europe** (Belgium, the Netherlands, Germany, and Poland), where it likely picked up pollutants that contribute to ozone formation."*

A detailed report on how Oxfordshire was impacted by these ozone episodes can be viewed [here](#).

Notes:

(1) 0m if the monitoring site is at a location of exposure (e.g. installed on the façade of a residential property).

(2) N/A if not applicable.

(3) These sites have not been put in place to directly assess the level of human exposure to air pollution, but instead to measure the potential impact of future transport schemes on traffic displacement. They are located in isolated areas, (mostly around Oxford's ring road), at a considerable distance from residential zones, and hence they are not relevant for the direct purposes of the LAQM regime.

Table A.3 – Annual Mean NO₂ Monitoring Results: Automatic Monitoring (µg/m³)

Site ID	X OS Grid Ref (Easting)	Y OS Grid Ref (Northing)	Site Type	Valid Data Capture for Monitoring Period (%) ⁽¹⁾	Valid Data Capture 2025 (%) ⁽²⁾	2021	2022	2023	2024	2025
CM1	451359	206157	Roadside	51%	51%	33	33	31	23	21
CM2	451677	206272	Roadside	90%	90%	30	31	27	21	17
CM3	451118	205353	Urban Background	96%	96%	11	12	9	9	11

☒ **Annualisation has been conducted where data capture is <75% and >25% in line with LAQM.TG22.**

☒ **Reported concentrations are those at the location of the monitoring site (annualised, as required), i.e. prior to any fall-off with distance correction.**

☒ **Where exceedances of the NO₂ annual mean objective occur at locations not representative of relevant exposure, the fall-off with distance concentration has been calculated and reported concentration provided in brackets for 2025.**

Notes:

The annual mean concentrations are presented as µg/m³.

Exceedances of the NO₂ annual mean objective of 40µg/m³ are shown in **bold**.

All means have been “annualised” as per LAQM.TG22 if valid data capture for the full calendar year is less than 75%. See Appendix C for details.

Concentrations are those at the location of monitoring and not those following any fall-off with distance adjustment.

(1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.

(2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

☒ Annualisation has been conducted where data capture is <75% and >25% in line with LAQM.TG22.

☒ Diffusion tube data has been bias adjusted.

☒ **Reported concentrations are those at the location of the monitoring site (bias adjusted and annualised, as required), i.e. prior to any fall-off with distance correction.**

Notes:

The annual mean concentrations are presented as $\mu\text{g}/\text{m}^3$.

Exceedances of the NO_2 annual mean objective of $40\mu\text{g}/\text{m}^3$ are shown in **bold**.

NO_2 annual means exceeding $60\mu\text{g}/\text{m}^3$, indicating a potential exceedance of the NO_2 1-hour mean objective are shown in **bold and underlined**.

Means for diffusion tubes have been corrected for bias. All means have been “annualised” as per LAQM.TG22 if valid data capture for the full calendar year is less than 75%. See Appendix C for details.

Concentrations are those at the location of monitoring and not those following any fall-off with distance adjustment.

(1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.

(2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

Table A.5 – 1-Hour Mean NO₂ Monitoring Results, Number of 1-Hour Means > 200µg/m³

Site ID	X OS Grid Ref (Easting)	Y OS Grid Ref (Northing)	Site Type	Valid Data Capture for Monitoring Period (%) ⁽¹⁾	Valid Data Capture 2025 (%) ⁽²⁾	2021	2022	2023	2024	2025

CM2	451677	206272	Roadside	90.39%	90.39%	0	0	0	0	0
CM3	451118	205353	Urban Background	96.45%	96.45%	0	0	0	0	0

Notes:

Results are presented as the number of 1-hour periods where concentrations greater than 200µg/m³ have been recorded.

Exceedances of the NO₂ 1-hour mean objective (200µg/m³ not to be exceeded more than 18 times/year) are shown in **bold**.

If the period of valid data is less than 85%, the 99.8th percentile of 1-hour means is provided in brackets.

(1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.

(2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

Table A.6 – Annual Mean PM₁₀ Monitoring Results (µg/m³)

Site ID	X OS Grid Ref (Easting)	Y OS Grid Ref (Northing)	Site Type	Valid Data Capture for Monitoring Period (%) ⁽¹⁾	Valid Data Capture 2025 (%) ⁽²⁾	2021	2022	2023	2024	2025

- ☒ All erroneous data has been removed from the NO₂ diffusion tube dataset presented in Table B.1.
- ☒ Annualisation has been conducted where data capture is <75% and >25% in line with LAQM.TG22.
- ☐ Local bias adjustment factor used.
- ☒ National bias adjustment factor used.
- ☒ Where applicable, data has been distance corrected for relevant exposure in the final column.
- ☒ Oxford City Council confirm that all 2025 diffusion tube data has been uploaded to the Diffusion Tube Data Entry System.

Notes:

Exceedances of the NO₂ annual mean objective of 40µg/m³ are shown in **bold**.

NO₂ annual means exceeding 60µg/m³, indicating a potential exceedance of the NO₂ 1-hour mean objective are shown in **bold and underlined**.

See Appendix C for details on bias adjustment and annualisation.

Appendix C: Supporting Technical Information / Air Quality Monitoring Data QA/QC

New or Changed Sources Identified Within Oxford City Council During 2025

Oxford City Council has not identified any new sources relating to air pollution within the reporting year 2025.

Additional Air Quality Works Undertaken by Oxford City Council During 2025

Oxford City Council has not completed any additional works within the reporting year of 2025.

QA/QC of Diffusion Tube Monitoring

Oxford's diffusion tubes were supplied and analysed in 2025 by the accredited laboratory (SOCOTEC), using a 50% Triethanolamine (TEA) in acetone method, and using a standard operating procedure (ANU/SOP/1015) that meets the guidelines set out in DEFRA's Diffusion Tubes for Ambient NO₂ Monitoring: Practical [Guidance](#).

SOCOTEC is subject to quality assurance testing as part of their accreditation. This involves an independent comparison to other laboratories, under the independent [AIR-PT](#) scheme. The results of the latest inter-comparisons are publicly available for scrutiny [here](#).

All the diffusion tubes used in the 2025 monitoring campaign were replaced according to DEFRA's 2025 diffusion tube monitoring [calendar](#) ± 2 days due date tolerance.

Diffusion Tube Annualisation

Only one of the 117 diffusion tube monitoring locations has not recorded data capture of a minimum of 75% in 2025 (which is equivalent to a minimum of 9 or more valid monthly averages throughout the 12-month calendar year). This monitoring site was A24 Wolvercote Meadows 2 (TF37) which had a data capture of 67%.

Table C.1 – Annualisation Summary (concentrations presented in µg/m³)

Site ID	Annualisation Factor St. Ebbes	Annualisation Factor Reading New Town	Average Annualisation Factor	Raw Data Annual Mean	Annualised Annual Mean
TF37	0.92	0.93	0.93	32.4	30.1

Diffusion Tube Bias Adjustment Factors

The diffusion tube data presented within the 2025 ASR have been corrected for bias using an adjustment factor. Bias represents the overall tendency of the diffusion tubes to under or over-read relative to the reference chemiluminescence analyser. LAQM.TG22 provides guidance with regard to the application of a bias adjustment factor to correct diffusion tube monitoring. Triplicate co-location studies can be used to determine a local bias factor based on the comparison of diffusion tube results with data taken from NO_x/NO₂ continuous analysers. Alternatively, the national database of diffusion tube co-location surveys provides bias factors for the relevant laboratory and preparation method.

Oxford City Council have applied a national bias adjustment factor of **0.78** to its 2025 diffusion tube monitoring data. This bias adjustment factor results from averaging the bias adjustment factors obtained from 17 studies conducted in 2025 from SOCOTEC Didcot (the same laboratory used by Oxford City Council) and using the same Acetone method (50% TEA).

This figure was obtained by consulting DEFRA's latest National Bias Adjustment Factor Spreadsheet, available [here](#), (published in March 2026).

A summary of bias adjustment factors used by Oxford City Council over the past five years is presented in Table C.2 below.

Table C.2 – Bias Adjustment Factor

Monitoring Year	Local or National	If National, Version of National Spreadsheet	Adjustment Factor
2025	National	03/2026	0.78
2024	National	04/2025	0.78
2023	Local	-	0.75
2022	Local	-	0.74

2021	Local	-	0.98
------	-------	---	------

Oxford City Council has decided to use a national bias adjustment factor (**0.78**) to adjust its diffusion tube data (rather than using the bias obtained by its local co-location study at AURN Oxford centre, which in 2025 was of **0.82**), due to:

- The poor data capture obtained by this automatic monitoring station for NO₂ in 2025 (only of 51%), and which has resulted in only 4 periods of data (out of the normal 12) being considered valid for use in the calculation of Oxford's local bias adjustment factor – potentially bringing poor robustness to the analysis.

Table C.3 below shows the calculations of the council's local bias, which ended up being disregarded.

Table C.3 – Local Bias Adjustment Calculation

	Local Bias Adjustment Input 1
Periods used to calculate bias	4
Bias Factor A	0.82 (0.72 - 0.97)
Bias Factor B	21% (3% - 40%)
Diffusion Tube Mean (µg/m ³)	25
Mean CV (Precision)	6
Automatic Mean (µg/m ³)	21
Data Capture	94%
Adjusted Tube Mean (µg/m ³)	21 (18-25)

NO₂ Fall-off with Distance from the Road

Wherever possible, monitoring locations are representative of exposure. However, where this is not possible, the NO₂ concentration at the nearest location relevant for exposure has been estimated using the Diffusion Tube Data Processing Tool/NO₂ fall-off with distance calculator available on the LAQM Support website. Where appropriate, non-automatic annual mean NO₂ concentrations corrected for distance are presented in Table B.1.

No diffusion tube NO₂ monitoring locations within Oxford City Council required distance correction during 2025.

QA/QC of Automatic Monitoring

Oxford City Council currently operates three automatic monitoring sites. All routine calibration and maintenance is carried out by members of Oxford City Council's Environmental Quality team and performed in accordance with manufacturers' and Automated Urban Monitoring Network site operators' manual. Instrument drift is routinely checked by:

- a daily internal instrument calibration which is carried out automatically using an electronic calibration check;
- every two weeks a manual external instrument calibration is carried out by Oxford City Council using gas cylinders that can be traced back to reference standards for each pollutant;
- every six months an audit of instrument response is carried out by an external organization using independent gas calibration standards.

The above checks enable data to be examined subsequently for instrument drift, which is expected, or for faulty data which is usually not expected. Before final publication of the air quality annual monitoring results for comparison against current legislation, the air quality data needs to be ratified.

Data Ratification is a detailed manual check of the data set carried out on a quarterly basis in all our automatic monitoring stations covered by the full QA/QC process. It requires a longer-term view of the dataset, incorporating the results from the independent QA/QC audits of the monitoring stations.

All the automatic monitoring data obtained in 2025 and presented within this ASR has been fully ratified by Ricardo Energy & Environment, following in full all the national AURN QA/QC procedures¹³. Live and historic data from our 3 automatic monitoring sites can be found on the following websites:

- [OXONAIR](#)
- [UK – Air](#)
- [AQ England](#)

¹³ [AURN QA QC Manual](#)

PM₁₀ and PM_{2.5} Monitoring Adjustment

The instruments used at AURN St Ebbes and Oxford High Street to measure PM₁₀ and PM_{2.5} data (FIDAS), do not require the application of any correction factor. PM_{2.5} data reported by the FIDAS instrument is automatically corrected to gravimetric equivalent by Ricardo Energy & Environment using the procedure described in TG22.

Automatic Monitoring Annualisation

All automatic monitoring locations within Oxford City Council recorded data capture of greater than 75% for all pollutants, with the exception of PM_{2.5} at Oxford Centre Roadside.

Refurbishment works to the façade of Oxford City Town Hall, where the Oxford Centre Roadside automatic monitoring site is located, were carried out between August 2025 and February 2026. During this period, the monitoring station was taken offline for the full duration of the works. The presence of scaffolding and construction activity on the building façade posed a significant risk of dust ingress to the analyser inlet, which could have compromised data quality. To prevent the collection of unrepresentative or unreliable monitoring data, the site was therefore shut down for approximately five months (August – December 2025) while the refurbishment works were ongoing. This led to the complete data capture of NO₂ at this site to be 51.43% in 2025.

The NO₂ annual mean at Oxford Centre therefore had to be annualised. The procedure followed was the one described in box 7-9 of the LAQM TG22 for the annualisation of continuous monitoring data. Table C.5 below shows the annualisation procedure that was undertaken, and which includes reference to the sites used for this correction.

Table C.4 – Automatic NO₂ Annualisation Summary Oxford Centre (concentrations presented in µg/m³)

Background Site	Annual Data Capture (%)	Annual Mean (A _m)	CM1	
			Period Mean (P _m)	Ratio (A _m / P _m)
Oxford St. Ebbes	96.45%	11	10.5	1.047619048
Reading New Town	99.01%	12	10.9	1.100917431
Average (R _a)			1.074268239	
Raw Data Annual Mean (M)			20	
Annualised Annual Mean (M x R _a)			21	

The period mean corresponds to the PM_{2.5} averages that were obtained at the 2 AURN sites for the period:

29/01/2025 15:00 until 30/01/2025 11:00

07/03/2025 3:00 until 10/03/2025 13:00

29/03/2025 1:00 until 04/04/2025 11:00

13/04/2025 21:00 until 07/05/2025 10:00

19/06/2025 2:00 until 27/06/2025 15:00

20/08/2025 9:00 until 31/12/2025 24:00

NO₂ Fall-off with Distance from the Road

No automatic NO₂ monitoring locations within Oxford City required distance correction during 2025.

Appendix D: Map of the City's AQMA

The Council previously declared Air Quality Management Areas (AQMA's) in central Oxford (2003) and at Green Road roundabout (2005), as those were the locations where the UK nitrogen dioxide objectives were not being met at the time. Following further detailed assessments (2008 and 2009); several additional areas were identified where the nitrogen dioxide objectives were being breached.

As such, in September 2010 the City Council made an Air Quality Management Order declaring the whole city an AQMA for NO₂. Figure 12 below shows (in blue) the area of the city currently covered by the AQMA for NO₂ and its boundaries. Figure 13 shows a print screen of OXONAir's interactive map, a resource where residents can identify all the locations where air quality monitoring was conducted throughout 2025 and the levels of NO₂ measured. All the monitoring locations are within Oxford's current AQMA, apart from the locations of diffusion tubes TF1, TF2, TF3.

Figure 12 - Boundary of Oxford's current city-wide AQMA for NO₂

Figure 13 - Map of Non-Automatic Monitoring Site

¹⁴ All of Oxford City Council diffusion tube locations and concentrations for the year 2025 can be found on the OXONAIR website after the publication of this annual status report.

Figure 14 - % of Oxford Air Quality Monitoring Sites Below Relevant NO₂ Thresholds**Air Quality Monitoring**% of Oxford sites below relevant NO₂ thresholds

Year	% Sites Below 40	% Sites Below 30	% Sites Below 20
2003	7.14%	7.14%	
2004	6.67%	6.67%	
2005	6.67%	6.67%	6.67%
2006	6.67%	6.67%	
2007	32.43%	18.92%	
2008	42.86%	11.43%	5.71%
2009	48.78%	14.63%	2.44%
2010	31.71%	9.76%	2.44%
2011	19.51%	9.76%	2.44%

2022	95.35%	82.17%	43.41%
2023	98.46%	92.31%	56.92%
2024	99.17%	96.67%	68.33%
2025	100.00%	97.50%	73.33%

Appendix E: Air Quality Objectives and WHO recommended guidelines

Table 16 – Air Quality Objectives in England¹⁵

Pollutant	Air Quality Objective: Concentration	Air Quality Objective: Measured as
Nitrogen Dioxide (NO ₂)	200µg/m ³ not to be exceeded more than 18 times a year	1-hour mean
Nitrogen Dioxide (NO ₂)	40µg/m ³	Annual mean
Particulate Matter (PM ₁₀)	50µg/m ³ , not to be exceeded more than 35 times a year	24-hour mean
Particulate Matter (PM ₁₀)	40µg/m ³	Annual mean
Particulate Matter (PM _{2.5})	10µg/m ³	Annual mean
Ozone (O ₃)	100 µg/m ³ not to be exceeded more than 10 times a year	8-hour mean

Table 17 – World Health Organization recommended air pollution guidelines.

Pollutant	Recommended guidelines for each pollutant	
	Concentration (µg/m ³)	Measured as
Nitrogen Dioxide (NO ₂)	200	1-hour mean
Nitrogen Dioxide (NO ₂)	25	24-hour mean
Nitrogen Dioxide (NO ₂)	10	Annual mean
Particulate Matter (PM ₁₀)	45	24-hour mean
Particulate Matter (PM ₁₀)	15	Annual mean
Particulate Matter (PM _{2.5})	15	24-hour mean
Particulate Matter (PM _{2.5})	5	Annual mean
Ozone (O ₃)	60	Peak season ¹⁶
Ozone (O ₃)	100	8-hour mean

¹⁵ The units are in microgrammes of pollutant per cubic metre of air (µg/m³).

¹⁶ Average of daily maximum 8 hour mean O₃ concentration in the six consecutive months with the highest six-month average O₃ concentration.

Glossary of Terms

Abbreviation	Description
AQAP	Air Quality Action Plan - A detailed description of measures, outcomes, achievement dates and implementation methods, showing how the local authority intends to achieve air quality limit values'
AQMA	Air Quality Management Area – An area where air pollutant concentrations exceed / are likely to exceed the relevant air quality objectives. AQMAs are declared for specific pollutants and objectives
ASR	Annual Status Report
Defra	Department for Environment, Food and Rural Affairs
DMRB	Design Manual for Roads and Bridges – Air quality screening tool produced by National Highways
LAQM	Local Air Quality Management
NO ₂	Nitrogen Dioxide
NO _x	Nitrogen Oxides
PM ₁₀	Airborne particulate matter with an aerodynamic diameter of 10µm or less
PM _{2.5}	Airborne particulate matter with an aerodynamic diameter of 2.5µm or less
QA/QC	Quality Assurance and Quality Control
SO ₂	Sulphur Dioxide
